What is Case Management

Case management is a multi-step collaborative process for the nurse to assess, plan, facilitate and communicate individual patient care that promotes patient safety. It is through evaluation and advocacy, that nurses provide resources and services which meet the patient's and family's comprehensive health needs.

By applying our philosophy of prevention and early detection to each case, our department is able to generate awareness and engage the individual in a course of action so they are able to live life to the fullest.

How Our Case Management Program Works

The Nurse Case Manager Specialist will receive the initial referral from either an Executive or an employee reaching out through the Executive Health Department's general email regarding a medical necessity. The Nurse Case Manager will respond in a timely manner to assess the need and provide medical direction.

Personal health information is then collected by the nurse case manager to assist in navigating the most appropriate treatment options. The Nurse Case Manager helps to identify suitable providers and facilities throughout the patient's continuum of care by collaborating with other medical professionals.

Initial Referral:

How the employee/patient is identified.

Assessing:

Collecting specific individualized health information to assist the nurse case manager in moving through the process.

Planning:

Navigating care by developing a treatment plan for the employee.

Implementation:

The execution of the individualized treatment plan.

Follow-up/Evaluation:

Evaluate the suitability and effectiveness of the treatment plan initiated for this specific employee.
