

## Fitment & Technical New Product TPMS Overstock Fixtures

### Features and Benefits

TPMS Overstock Fixtures are organizing solutions for your TPMS inventory that promote "first in, first out" usage, which is an important inventory process for rubber products and technology that moves quickly.

**Before ordering additional fixtures, first check these 3 things to make sure you actually need them!**

1. Is your overflow product in N-out status? If so, it will go away and doesn't need a long term stocking solution.
2. Is your inventory level correct? You should have a max stocking level = to 4-6 weeks of sales. If you have more on hand than 6 weeks of sales, your inventory levels will go down naturally.
3. Are you stocking your top 4 rebuild kits in the Tire machine valve bins? You should be. These bins should be quick access to 50 units of each kit per machine. This will reduce the overflow box count of these products.

### Example

#### Instructions

Contact your maintenance team to ensure installation is appropriate for the harsh back room environment.
